

Curso del Posgrado en Ciencias Físicas 2024-2

CORRESPONDENCIA HOLOGRÁFICA

Alberto Güijosa, alberto@nucleares.unam.mx

Clases: Lunes y Miércoles 16:00-18:00 (empezando 16:10 en punto),

Salón de Seminarios de Gravitación y Altas Energías (A225)

Instituto de Ciencias Nucleares, UNAM

La correspondencia holográfica es una muy sorprendente equivalencia entre teorías cuánticas de campos (sin gravedad) y teorías de gravedad cuántica (prominentemente, teorías de cuerdas). Además de lo revolucionario que resulta desde el punto de vista conceptual el mero hecho de su existencia, esta correspondencia se ha establecido ya como una herramienta muy útil para entender el comportamiento de algunas teorías de campos en el régimen de acoplamiento fuerte, y ofrece una perspectiva novedosa sobre los aspectos problemáticos de la gravedad cuántica. Se trata de un tema extremadamente amplio (el artículo original de Maldacena, hep-th/9711200, ha recibido ya más de 19,300 citas, ¡que equivalen a un promedio de 3 por día hábil durante 26 años!), así que solo intentaremos dar un panorama de algunas de las ideas principales.

Temario Preliminar

0. **Motivación y Antecedentes:** ¿Qué es la correspondencia norma-gravedad? Teorías de Campo. Acoplamiento Débil y Fuerte. QED. QCD. Primas de QCD, N grande y MSYM. Gravedad Cuántica. Holografía.
1. **Deducción de la Correspondencia:** Breve repaso de cuerdas, branjas negras y D-branas. Deducción de AdS₅/CFT₄ a partir de D3-branas.
2. **Evidencias y Diccionario:** Espacio anti-de Sitter. Mapeo de coordenadas y simetrías. Conexión UV/IR. Operadores locales. Teoría de campo conforme. Funciones de correlación. Modos normalizables y no normalizables. BMN y estados cuánticos con números grandes. Quarks. Lazos de Wilson y potencial quark-antiquark. El grupo de renormalización holográfico.
3. **AdS/CFT a Temperatura Finita:** Schwarzschild-anti de Sitter. Aplicaciones al plasma de quarks y gluones. Bekenstein-Hawking y la entropía. Schwinger-Keldysh, Kubo y la viscosidad. Correspondencia fluidos/gravedad.
4. **Entropía de entrelazamiento.** Entropía de entrelazamiento. Entrelazamiento en teorías de campos y el truco de réplica. Fórmula de Ryu-Takayanagi. Entropía diferencial y geometría integral. Diccionario invariante bajo difeos.
5. **Generalizaciones (si el tiempo lo permite).** MSYM en otras geometrías. Otras CFTs a partir de D3s en otros fondos, u otro tipo de branjas. No-AdS/ No-CFT: Dp-branas, deformaciones. Sakai-Sugimoto(-Witten). Modelos "de abajo para arriba". Algunas aplicaciones a materia condensada. Teorías de Alto Espín.

Información Importante

Las notas del curso (que ocasionalmente iré actualizando) están en la página

<https://nucleares.unam.mx/~alberto/apuntes/indice.html#posholografia>

Para ahorrar tiempo, el curso lo daré proyectando las notas, así que les resultará conveniente si acaso pueden tener una versión impresa o electrónica para ir haciendo anotaciones sobre ella (pues les será muy difícil tomar apuntes). Este formato tiene sus ventajas (principalmente, que podemos irnos más rápido), pero tengan presente que tiene también desventajas (principalmente, ¡que corremos el riesgo de irnos *demasiado* rápido!). Puede ser muy engañoso: a menos que en verdad hagan un esfuerzo por seguir en detalle lo que voy explicando e irme deteniendo con preguntas, van a tener la placentera ilusión de que todo es muy claro cuando expongo las ideas en la pantalla, pero no van a asimilar gran cosa. Por favor convénzanse entonces desde ahora de que el que aprendan depende principalmente no de mí sino de ustedes: **es muy recomendable que estudien el material (incluso consultando otras fuentes) por fuera de la clase, y también que me vayan frenando/retroalimentando con preguntas y comentarios.**

Para algunas partes del curso puede resultarles útil también mi artículo de revisión
arxiv.org/abs/1611.07472

(además de los libros de Nastase y Ammon & Erdmenger indicados abajo, junto con el artículo de revisión de “MAGOO” = Maldacena-Aharony-Gubser-Ooguri-Oz).

Dibujos amigables para la introducción del curso pueden encontrarse (en PowerPoint o pdf) en mi minicurso más reciente (DGFM-SMF)

www.nucleares.unam.mx/~alberto/platicas/entrelazagravedaddgf.ppt
www.nucleares.unam.mx/~alberto/platicas/entrelazagravedaddgf.pdf

y para el resto del curso, en el minicurso un poco anterior (MexiCOPAS)
www.nucleares.unam.mx/~alberto/platicas/emc2017.ppt
www.nucleares.unam.mx/~alberto/platicas/emc2017.pdf

Una versión relámpago de parte del material del curso a nivel de licenciatura está en
<http://www.nucleares.unam.mx/~alberto/apuntes/indice.html#minihografia>

Pre-requisitos para el curso:

Trataré de que el curso sea autocontenido, en la medida de lo posible. Todas y todos los oyentes son por supuesto bienvenidos; pero para aprovechar mejor el curso, es altamente deseable que conozcan ya las ideas básicas de teoría cuántica de campos y relatividad general. Si requieren ayuda en esos temas, pueden consultar, por ejemplo,

M. E. Peskin y D. V. Schroeder, *An Introduction to Quantum Field Theory*, Addison-Wesley (1995).

B. F. Schutz, *A First Course in General Relativity*, Cambridge University Press (1994).

En ocasiones resultaría útil también (aunque NO será indispensable) cierta familiaridad con algunas ideas básicas de cuerdas, al nivel de, p.ej.,

K. Becker, M. Becker y J. H. Schwarz, *String Theory and M Theory*, Cambridge University Press (2007).

J. Polchinski, *String Theory*, Cambridge University Press (1998), vols. I y II.

Bibliografía

Para una lista extensa (¡que falta actualizar!) de artículos de revisión sobre distintos temas de cuerdas, ir a
